

Hotel Room Booking System

This is a Java console application that simulates a hotel room booking system. It allows users to book rooms, check room availability, check the status of their bookings, and check out from the hotel.

Features

- **Room Availability:** Users can check the availability of rooms in the hotel.
- **Room Booking:** Users can book rooms by providing their name, phone number, and number of days they intend to stay.
- **Check Status:** Users can check the status of their bookings, including the remaining number of days.
- **Check Out:** Users can check out from the hotel and free up the booked room for other customers.

Prerequisites

- Java Development Kit (JDK)
- MySQL database

Getting Started

1. Clone the repository: **git clone <repository-url>**
2. Set up the MySQL database and configure the connection details in the code.
3. Compile the Java code: **javac App.java**
4. Run the application: **java App**

Usage

- Follow the on-screen instructions to perform various operations such as booking a room, checking room status, or checking out.
- The application will interact with the user through the console interface.
